“ Automatic Cycle Counting ” eliminates the need to flag each inventory item with the cycle tags. This Granule automatically identifies items to be counted based on the users ’ parameters. You define the frequency of count and the number of items to be counted. The process compares the count log to the parameters and presents the next set of items to be counted.

The benefit is obvious: Zero maintenance of your Item Master. Zero resistance from your users to perform the weekly count. You set the number of items to be counted this week. (IE: 35) Set Filters for Location or Range of Items to be counted. Print Inventory Count Worksheet, do the count, record the results, and update your inventory with accurate data.
